

# Culvert Cisterns

for rainwater harvesting

With steel culvert cisterns the rainwater runs off your roof, down through your rain gutter system, through an input pipe and into the bottom of the cistern. The water rises until it reaches the top of the overflow pipe, located in the middle of the cistern. Once the tank is full, the extra water flows into the overflow pipe and out to a designated

area on your property.

To clean the tank you simply open the clean out valve and drain the tank. Once the tank is drained you can use a hose to spray out the inside of the tank and wash out any debris or sediment that has collected. Close the valve and the cistern is ready to collect more water.

Here is a sample of some of our standard sizes and pricing information.

Size	Capacity	Price
3 x 8	420 Gallons	\$2300
4 x 8	750 Gallons	\$2550
5 x 8	1000 Gallons	\$2800
6 x 8	1680 Gallons	\$2800
